worked solution
after each
question

Question 1

Integration

1. $y = 4x^3 + \frac{3}{2\sqrt{x}} - 8 \quad x > 0$

Find, in simplest form,

(a) $\frac{dy}{dx}$ (3)

(b) $\int y \, dx$ (3)

(Total for Question 1 is 6 marks)

Worked Solution - Question 1

1. Rewrite with powers

$$y = 4x^3 + \frac{3}{2}x^{-1/2} - 8.$$

2. Differentiate

$$\frac{dy}{dx} = 12x^2 + \frac{3}{2} \left(-\frac{1}{2} \right) x^{-3/2}.$$

3. Simplify derivative

$$\frac{dy}{dx} = 12x^2 - \frac{3}{4}x^{-3/2} = 12x^2 - \frac{3}{4x^{3/2}}.$$

4. Integrate

$$\int y \, dx = \int \left(4x^3 + \frac{3}{2}x^{-1/2} - 8 \right) dx.$$

5. Simplify integral

$$\int y \, dx = x^4 + 3x^{1/2} - 8x + c = x^4 + 3\sqrt{x} - 8x + c.$$

Final answer

$$(a) \frac{dy}{dx} = 12x^2 - \frac{3}{4x^{3/2}}.$$

$$(b) \int y \, dx = x^4 + 3\sqrt{x} - 8x + c.$$

Question 2

Simultaneous Equations

2.

In this question you must show all stages of your working.
Solutions relying on calculator technology are not acceptable.

(a) Given

$$y - x = 4$$

and

$$2x^2 - xy = 8$$

show that

$$x^2 - 4x - 8 = 0$$

(2)

(b) Hence solve the simultaneous equations

$$y - x = 4$$

$$2x^2 - xy = 8$$

writing the answers in the form $p + q\sqrt{3}$, where p and q are integers to be found.

(4)

(Total for Question 2 is 6 marks)

Worked Solution - Question 2

1. Use the linear equation

$$y - x = 4, \text{ so } y = x + 4.$$

2. Substitute into the second equation

$$2x^2 - xy = 8 \text{ becomes } 2x^2 - x(x + 4) = 8.$$

3. Show the quadratic

$$2x^2 - x^2 - 4x = 8, \text{ so } x^2 - 4x - 8 = 0.$$

4. Complete the square

$$x^2 - 4x - 8 = 0 \text{ gives } (x - 2)^2 = 12.$$

5. Find x

$$x = 2 \pm \sqrt{12} = 2 \pm 2\sqrt{3}.$$

6. Find y

$$\text{Since } y = x + 4, y = 6 \pm 2\sqrt{3} \text{ with matching signs.}$$

7. State both solutions

$$(x, y) = (2 + 2\sqrt{3}, 6 + 2\sqrt{3}) \text{ or } (2 - 2\sqrt{3}, 6 - 2\sqrt{3}).$$

Final answer

$$(x, y) = (2 + 2\sqrt{3}, 6 + 2\sqrt{3}) \text{ or } (2 - 2\sqrt{3}, 6 - 2\sqrt{3}).$$

WMA11/01 JANUARY 2026

5 marks

Question 3

Inequalities

3. (i) Find the range of values of z for which

$$\frac{4}{z} < 8$$

giving the answer in simplest form.

(2)

(ii)

Figure 1

Figure 1 shows a plot of

- the line with equation $y = x + 5$
- the curve with equation $y = x(x - 3)$

On the opposite page there is a copy of Figure 1 labelled Diagram 1.

On Diagram 1 represent the following inequality graphically.

$$x + 5 \leq y \leq x(x - 3) \quad \text{for } x \geq -2$$

(3)

Question 3 continued

Diagram 1

(Total for Question 3 is 5 marks)

Worked Solution - Question 3

1. Solve the rational inequality

$$\frac{4}{z} < 8 \text{ gives } \frac{4}{z} - 8 < 0, \text{ so } \frac{4 - 8z}{z} < 0.$$

2. Use critical values

The critical values are $z = 0$ and $z = \frac{1}{2}$.

3. State the range

A sign check gives $z < 0$ or $z > \frac{1}{2}$.

4. Find where line and curve meet

$$x + 5 = x(x - 3) \text{ gives } x^2 - 4x - 5 = 0, \text{ so } (x - 5)(x + 1) = 0.$$

5. Combine with x greater than or equal to -2

The inequality $x + 5 \leq y \leq x(x - 3)$ is possible when $x \leq -1$ or $x \geq 5$. With $x \geq -2$, the shaded x-ranges are $-2 \leq x \leq -1$ and $x \geq 5$.

6. Graphical representation

Draw the vertical boundary $x = -2$ and shade the two regions between the line and the parabola: from $x = -2$ to $x = -1$, and to the right of $x = 5$.

Final answer

(i) $z < 0$ or $z > \frac{1}{2}$. (ii) shade the region above $y = x + 5$, below $y = x(x - 3)$, with $x \geq -2$.

Question 4

Straight Line

4.

**In this question you must show all stages of your working.
Solutions relying on calculator technology are not acceptable.**

The point $A(-1, 8)$ and the point $B(7, 2)$ lie on the line L_1

- (a) Find an equation for L_1 in the form $ax + by + c = 0$, where a , b and c are integers. (3)

The line L_2

- passes through A and is perpendicular to L_1
- cuts the x -axis at the point C

- (b) Find the coordinates of C . (3)

- (c) Hence find the area of triangle ABC . (3)

(Total for Question 4 is 9 marks)

Worked Solution - Question 4

1. Gradient of L_1

Using $A(-1, 8)$ and $B(7, 2)$, $m = \frac{2 - 8}{7 - (-1)} = -\frac{6}{8} = -\frac{3}{4}$.

2. Equation of L_1

$$y - 2 = -\frac{3}{4}(x - 7).$$

3. Rearrange

$$4y - 8 = -3x + 21, \text{ hence } 3x + 4y - 29 = 0.$$

4. Gradient of L_2

Since L_2 is perpendicular to L_1 , its gradient is $\frac{4}{3}$.

5. Equation of L_2

L_2 passes through $A(-1, 8)$, so $y - 8 = \frac{4}{3}(x + 1)$.

6. Find C

At the x-axis, $y = 0$, so $-8 = \frac{4}{3}(x + 1)$. Hence $x + 1 = -6$ and $x = -7$, giving $C = (-7, 0)$.

7. Find perpendicular side lengths

$$AB = \sqrt{8^2 + (-6)^2} = 10 \text{ and } AC = \sqrt{(-6)^2 + (-8)^2} = 10.$$

8. Area of triangle ABC

Since $AB \perp AC$, Area = $\frac{1}{2}(10)(10) = 50$.

Final answer

(a) $3x + 4y - 29 = 0$.

(b) $C = (-7, 0)$.

(c) 50.

Question 5

Radians

5.

In this question you must show all stages of your working.
Solutions relying entirely on calculator technology are not acceptable.

Diagram NOT
to scale

Figure 2

Figure 2 shows the logo for the tourist board of an island.

The logo consists of a sector $BODCB$ of a circle centre O joined to a triangle AOD .

Given that

- ABO is a straight line
- $OD = 3$ cm
- $AD = 8$ cm
- angle $AOD = 2.5$ radians

(a) show that angle ODA is 0.415 radians to 3 significant figures.

(3)

(b) Find the total area of the logo, in cm^2 , to one decimal place.

(3)

(c) Find the perimeter of the logo, $ABCD A$, in cm, to one decimal place.

(3)

(Total for Question 5 is 9 marks)

Worked Solution - Question 5

1. Use triangle AOD

In triangle AOD , $OD = 3$, $AD = 8$ and $\angle AOD = 2.5$ radians.

2. Use the sine rule

$$\frac{\sin \angle OAD}{3} = \frac{\sin 2.5}{8}, \text{ so } \angle OAD = \sin^{-1} \left(\frac{3 \sin 2.5}{8} \right) = 0.2263 \dots$$

3. Show angle ODA

$\angle ODA = \pi - 2.5 - 0.2263 \dots = 0.4152 \dots$, so $\angle ODA = 0.415$ radians to 3 significant figures.

4. Area of the major sector

The sector has radius 3 and angle $2\pi - 2.5$, so its area is

$$\frac{1}{2}(3)^2(2\pi - 2.5) = 17.02 \dots$$

5. Area of triangle AOD

$$\text{Area of triangle } AOD = \frac{1}{2}(3)(8) \sin 0.4152 \dots = 4.84 \dots$$

6. Total area

$17.02 \dots + 4.84 \dots = 21.86 \dots$, so the area is 21.9 cm^2 to one decimal place.

7. Find AO

By the cosine rule, $AO^2 = 3^2 + 8^2 - 2(3)(8) \cos 0.4152 \dots$, so $AO \approx 5.39 \text{ cm}$.

8. Find AB

Since A, B, O are collinear and $OB = 3$, $AB = AO - OB \approx 5.39 - 3 = 2.39 \text{ cm}$.

9. Perimeter

$AB + \text{major arc } BD + AD = 2.39\dots + 3(2\pi - 2.5) + 8 = 21.7 \text{ cm}$ to one decimal place.

Final answer

(a) $\angle ODA = 0.415 \text{ rad}$.

(b) 21.9 cm^2 .

(c) 21.7 cm .

WMA11/01 JANUARY 2026

9 marks

Question 6

Polynomials

6.

Figure 3

Figure 3 shows a sketch of the curve C with equation $y = f(x)$ where $f(x)$ is a cubic function in x .

The curve C

- cuts the x -axis at $(-2, 0)$ and cuts the y -axis at $(0, 10)$
- touches the x -axis at $(5, 0)$

as shown in Figure 3.

(a) Deduce the roots of the equation

(i) $f\left(\frac{1}{3}x\right) = 0$

(ii) $f(x - 3) = 0$

(2)

(b) Find an expression for $f(x)$. You should leave your answer in factorised form.

(3)

The curve C intersects the straight line $y = 10(x + 2)$ at exactly three points.

(c) Use algebra to find the exact x coordinates of the three points of intersection.

(Solutions based entirely on calculator technology are not acceptable.)

(4)

(Total for Question 6 is 9 marks)

Worked Solution - Question 6

1. Roots of f one third x

The roots of $f(x) = 0$ are $x = -2$ and $x = 5$, with $x = 5$ repeated. For $f\left(\frac{1}{3}x\right) = 0$, set $\frac{1}{3}x = -2$ or 5 , giving $x = -6$ or 15 .

2. Roots of f of x minus 3

For $f(x - 3) = 0$, set $x - 3 = -2$ or 5 , giving $x = 1$ or 8 .

3. Use the roots and repeated root

Since the curve cuts at $(-2, 0)$ and touches at $(5, 0)$, write $f(x) = k(x + 2)(x - 5)^2$.

4. Use the y-intercept

The curve passes through $(0, 10)$, so $10 = k(2)(25) = 50k$.

5. State $f(x)$

$k = \frac{1}{5}$, hence $f(x) = \frac{1}{5}(x + 2)(x - 5)^2$.

6. Set equal to the line

$$\frac{1}{5}(x + 2)(x - 5)^2 = 10(x + 2).$$

7. First solution

The factor $x + 2$ gives one solution $x = -2$.

8. Find the other solutions

For $x \neq -2$, divide by $x + 2$: $\frac{1}{5}(x - 5)^2 = 10$, so $(x - 5)^2 = 50$.

9. State all intersections

$x = 5 \pm \sqrt{50} = 5 \pm 5\sqrt{2}$. Therefore the three x-coordinates are -2 , $5 - 5\sqrt{2}$ and $5 + 5\sqrt{2}$.

Final answer

(a)(i) $-6, 15$. (a)(ii) $1, 8$.

(b) $f(x) = \frac{1}{5}(x+2)(x-5)^2$.

(c) $x = -2, 5 \pm 5\sqrt{2}$.

Question 7

Differentiation

7. The curve C has equation

$$y = \frac{2}{3}x^3 - 8x^2 + 43x - \frac{20}{3}$$

(a) Show that $\frac{dy}{dx}$ can be written in the form

$$p(x + q)^2 + r$$

where p , q and r are constants to be found.

(5)

(b) Hence state

(i) the minimum value of $\frac{dy}{dx}$

(ii) the value of x at which this minimum value occurs.

(2)

Given that S is the point on C at which the gradient is a minimum,

(c) find the equation of the tangent to C at S , giving your answer in the form $y = mx + c$, where m and c are constants.

(3)

(Total for Question 7 is 10 marks)

Worked Solution - Question 7

1. Differentiate

$$y = \frac{2}{3}x^3 - 8x^2 + 43x - \frac{20}{3} \text{ gives } \frac{dy}{dx} = 2x^2 - 16x + 43.$$

2. Complete the square

$$2x^2 - 16x + 43 = 2(x^2 - 8x) + 43 = 2[(x - 4)^2 - 16] + 43.$$

3. Simplify

$$\frac{dy}{dx} = 2(x - 4)^2 + 11.$$

4. Minimum gradient

Since $2(x - 4)^2 \geq 0$, the minimum value of $\frac{dy}{dx}$ is 11.

5. Where it occurs

The minimum occurs when $x - 4 = 0$, so $x = 4$.

6. Find the point S

$$\text{At } x = 4, y = \frac{2}{3}(4)^3 - 8(4)^2 + 43(4) - \frac{20}{3} = 80.$$

7. Tangent equation

The gradient at S is 11, so $y - 80 = 11(x - 4)$.

8. Simplify

$$y = 11x + 36.$$

Final answer

(a) $\frac{dy}{dx} = 2(x - 4)^2 + 11.$

(b) $\min \frac{dy}{dx} = 11 \text{ at } x = 4.$

(c) $y = 11x + 36.$

Question 8

Integration

8.

**In this question you must show all stages of your working.
Solutions relying on calculator technology are not acceptable.**

A curve C has equation $y = f(x)$, $x > 0$

A point P lies on C .

Given that

- $f'(x) = 4x^2 + \frac{6}{x^2} - 4$
- the equation of the tangent to C at P is $y = 10x - 6\sqrt{3}$

- (a) (i) verify that $\sqrt{3}$ is a possible x coordinate of P ,
(ii) find, using algebra, the other possible x coordinate of P .

(6)

Given that the x coordinate of P is $\sqrt{3}$

- (b) find an equation of the normal to C at P .

(2)

- (c) Find $f(x)$, writing your answer in simplest form.
You must show each stage of your working.

(4)

(Total for Question 8 is 12 marks)

Worked Solution - Question 8

1. Verify x equals root 3

$f'(\sqrt{3}) = 4(\sqrt{3})^2 + \frac{6}{(\sqrt{3})^2} - 4 = 12 + 2 - 4 = 10$, which matches the tangent gradient.

2. Find all possible x -coordinates

Set $4x^2 + \frac{6}{x^2} - 4 = 10$.

3. Form a quadratic in x squared

Multiplying by x^2 gives $4x^4 - 14x^2 + 6 = 0$, so $2x^4 - 7x^2 + 3 = 0$.

4. Factor

$$2x^4 - 7x^2 + 3 = (2x^2 - 1)(x^2 - 3) = 0.$$

5. Use x greater than zero

$x = \sqrt{3}$ or $x = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2}$. The other possible x -coordinate is $\frac{\sqrt{2}}{2}$.

6. Find the point P

Given $x_P = \sqrt{3}$, the tangent gives $y_P = 10\sqrt{3} - 6\sqrt{3} = 4\sqrt{3}$.

7. Normal equation

The normal gradient is $-\frac{1}{10}$, so $y - 4\sqrt{3} = -\frac{1}{10}(x - \sqrt{3})$.

8. Integrate f prime

$$f(x) = \int \left(4x^2 + \frac{6}{x^2} - 4 \right) dx = \frac{4}{3}x^3 - \frac{6}{x} - 4x + c.$$

9. Use P to find c

$$4\sqrt{3} = \frac{4}{3}(\sqrt{3})^3 - \frac{6}{\sqrt{3}} - 4\sqrt{3} + c = 4\sqrt{3} - 2\sqrt{3} - 4\sqrt{3} + c.$$

10. State f(x)

$$c = 6\sqrt{3}, \text{ so } f(x) = \frac{4}{3}x^3 - \frac{6}{x} - 4x + 6\sqrt{3}.$$

Final answer

(a)(i) verified.

$$(a)(ii) x = \frac{\sqrt{2}}{2}.$$

$$(b) y - 4\sqrt{3} = -\frac{1}{10}(x - \sqrt{3}).$$

$$(c) f(x) = \frac{4}{3}x^3 - \frac{6}{x} - 4x + 6\sqrt{3}.$$

WMA11/01 JANUARY 2026

9 marks

Question 9

Trigonometric Functions

9.

Figure 4

Figure 4 shows a sketch of part of the graph of the trigonometric function with equation $y = f(x)$.

(a) Write down an expression for $f(x)$.

(2)

Copies of Figure 4 (labelled Diagram 1 and Diagram 2) can be found on the following pages.

(b) (i) On Diagram 1 sketch a graph of the curve with equation

$$y = 10 - x^2$$

(ii) Hence find the **number** of solutions of the equation

$$f(x) = 10 - x^2 \quad \text{in the interval } -100\pi \leq x \leq 100\pi$$

(3)

(c) (i) On Diagram 2 sketch a graph of the curve with equation

$$y = \tan x \quad -2\pi \leq x \leq 2\pi$$

(ii) Hence find the **number** of solutions of the equation

$$f(x) = \tan x \quad \text{in the interval } -100\pi \leq x \leq 100\pi$$

giving a reason for your answer.

(4)

(a) _____

(b)(i)

Diagram 1

Copy of Diagram 1

Only use this copy if you need to redraw your graph.

(b)(ii) _____

(c)(i)

Diagram 2

Copy of Diagram 2

Only use this copy if you need to redraw your graph.

(c)(ii) _____

(Total for Question 9 is 9 marks)

Worked Solution - Question 9

1. Identify $f(x)$

The graph has amplitude 10, period 2π , and value -10 at $x = 0$, so $f(x) = -10 \cos x$.

2. Sketch y equals 10 minus x squared

The graph $y = 10 - x^2$ is a downward-opening parabola with vertex $(0, 10)$ and x -intercepts at $x = \pm\sqrt{10}$.

3. Count intersections with the parabola

On the given sketch, the parabola meets $f(x)$ twice. Outside the central part the parabola is below the range of $f(x)$, so there are 2 solutions in $-100\pi \leq x \leq 100\pi$.

4. Sketch y equals $\tan x$

The graph $y = \tan x$ has zeros at integer multiples of π and vertical asymptotes at $x = \frac{\pi}{2} + n\pi$.

5. Count in the reference interval

In $-2\pi \leq x \leq 2\pi$, the graph $y = \tan x$ intersects $f(x)$ four times.

6. Scale to the required interval

The interval $-100\pi \leq x \leq 100\pi$ is 50 times as long as $-2\pi \leq x \leq 2\pi$, so the number of solutions is $50 \times 4 = 200$.

Final answer

(a) $f(x) = -10 \cos x$.

(b)(ii) 2.

(c)(ii) 200.
