Answers

worked solution
after each
question

Question 1

Indices & Surds

1. Given that

$$p = \frac{1}{16}x^4 \qquad q = \frac{40}{x^3}$$

express each of the following in the form kx^n where k and n are fully simplified constants.

(a) $p^{\frac{1}{2}}$ (1)

(b) $(pq)^{-1}$ (2)

(c) pq^2 (2)

(Total for Question 1 is 5 marks)

Worked Solution - Question 1

Primary topic

1. Simplify p

$$p = \frac{1}{16}x^4.$$

2. Part (a)

$$p^{1/2} = \left(\frac{1}{16}x^4\right)^{1/2} = \frac{1}{4}x^2.$$

3. Simplify pq

$$pq = \frac{1}{16}x^4 \cdot \frac{40}{x^3} = \frac{5}{2}x.$$

4. Part (b)

$$(pq)^{-1} = \left(\frac{5}{2}x\right)^{-1} = \frac{2}{5}x^{-1}.$$

5. Part (c)

$$pq^2 = \frac{1}{16}x^4 \left(\frac{40}{x^3}\right)^2 = \frac{1600}{16}x^{-2} = 100x^{-2}.$$

Final answer

$$(a) \frac{1}{4}x^2.$$

$$(b) \frac{2}{5}x^{-1}.$$

$$(c) 100x^{-2}.$$

Question 2

Differentiation

2. The curve C has equation

$$y = 2x^{\frac{5}{2}} - 4x + 3$$

(a) Find $\frac{dy}{dx}$ writing your answer in simplest form.

(2)

The point P lies on C .

Given that

- the x coordinate of P is 2^k where k is a constant
- the gradient of C at the point P is 16

(b) find the value of k .

(3)

(Total for Question 2 is 5 marks)

Worked Solution - Question 2

1. Differentiate

$$y = 2x^{5/2} - 4x + 3, \text{ so } \frac{dy}{dx} = 2 \cdot \frac{5}{2}x^{3/2} - 4 = 5x^{3/2} - 4.$$

2. Use the gradient at P

At P , the gradient is 16, so $5x^{3/2} - 4 = 16$.

3. Find x

$$5x^{3/2} = 20, \text{ hence } x^{3/2} = 4.$$

4. Use x equals 2 to the k

Since the x-coordinate of P is 2^k , we have $(2^k)^{3/2} = 4 = 2^2$.

5. Solve for k

$$2^{3k/2} = 2^2, \text{ so } \frac{3k}{2} = 2 \text{ and } k = \frac{4}{3}.$$

Final answer

$$(a) \frac{dy}{dx} = 5x^{3/2} - 4.$$

$$(b) k = \frac{4}{3}.$$

Question 3

Integration

3. Find

$$\int \frac{(x+3)^2}{3\sqrt{x}} dx$$

writing your answer in simplest form.

(5)

(Total for Question 3 is 5 marks)

Worked Solution - Question 3

1. Expand the numerator

$$(x + 3)^2 = x^2 + 6x + 9.$$

2. Divide by the denominator

$$\frac{(x + 3)^2}{3\sqrt{x}} = \frac{x^2 + 6x + 9}{3x^{1/2}} = \frac{1}{3}x^{3/2} + 2x^{1/2} + 3x^{-1/2}.$$

3. Integrate term by term

$$\int \left(\frac{1}{3}x^{3/2} + 2x^{1/2} + 3x^{-1/2} \right) dx = \frac{1}{3} \cdot \frac{2}{5}x^{5/2} + 2 \cdot \frac{2}{3}x^{3/2} + 3 \cdot 2x^{1/2} + c.$$

4. Simplify

$$\frac{2}{15}x^{5/2} + \frac{4}{3}x^{3/2} + 6x^{1/2} + c.$$

Final answer

$$\frac{2}{15}x^{5/2} + \frac{4}{3}x^{3/2} + 6x^{1/2} + c.$$

Question 4

Trigonometric Functions

4.

Figure 1

Figure 1 shows a sketch of part of the curve with equation

$$y = 4 \cos x$$

where x is measured in degrees.

The points P and Q lie on the curve and are shown in Figure 1.

(a) State the coordinates of P .

(1)

(b) State the coordinates of Q .

(2)

(c) State the **number** of solutions of the equation

(i) $4 \cos x = 3$ in the interval $0 < x \leq 18\,000^\circ$

(ii) $5 + 4 \cos x = 1$ in the interval $-720^\circ < x \leq 720^\circ$

(iii) $4 \cos x - 3 = 1$ in the interval $-1080^\circ \leq x \leq 1080^\circ$

(3)

(Total for Question 4 is 6 marks)

Worked Solution - Question 4

Primary topic

1. Point P

For $y = 4 \cos x$, the x-intercepts occur at $x = 90^\circ + 180^\circ n$. The labelled point P is the right-hand intercept after 180° , so $P = (270^\circ, 0)$.

2. Point Q

The minimum value is -4 , reached at $x = 180^\circ + 360^\circ n$. The labelled point on the left is $Q = (-180^\circ, -4)$.

3. Part c(i)

$4 \cos x = 3$ has two solutions every 360° . The interval $[0, 360^\circ]$ contains two solutions.

4. Part c(ii)

$5 + 4 \cos x = 1$ gives $\cos x = -1$. This occurs once every 360° . In $[-720^\circ, 720^\circ]$, there are three solutions.

5. Part c(iii)

$4 \cos x - 3 = 1$ gives $\cos x = 1$. In $-1080^\circ \leq x \leq 1080^\circ$, the multiples of 360° are $-1080, -720, -360, 0, 360, 720, 1080$, so there are 7.

Final answer

(a) $P = (270^\circ, 0)$.

(b) $Q = (-180^\circ, -4)$.

(c)(i) 100, (ii) 4, (iii) 7.

Question 5

Straight Line

5.

**In this question you must show all stages of your working.
Solutions relying on calculator technology are not acceptable.**

The line l_1 has equation

$$x - 2y + 25 = 0$$

The line l_2 passes through the origin and is perpendicular to l_1

- (a) Find an equation for l_2 (2)

The lines l_1 and l_2 intersect at the point P .

- (b) Use algebra to find the coordinates of P . (3)

- (c) Hence find the shortest distance from l_1 to the origin.

Write your answer as a fully simplified surd. (2)

(Total for Question 5 is 7 marks)

Worked Solution - Question 5

1. Find the gradient of l_1

$l_1 : x - 2y + 25 = 0$ gives $y = \frac{1}{2}x + \frac{25}{2}$, so its gradient is $\frac{1}{2}$.

2. Use perpendicular gradient

A line perpendicular to l_1 has gradient -2 .

3. Use the origin

Since l_2 passes through the origin, its equation is $y = -2x$.

4. Find the intersection

Substitute $y = -2x$ into $x - 2y + 25 = 0$ to get $x + 4x + 25 = 0$.

5. Coordinates of I

$5x + 25 = 0$, so $x = -5$ and $y = 10$. Hence $I = (-5, 10)$.

6. Shortest distance from I to origin

The distance is $\sqrt{(-5)^2 + 10^2} = \sqrt{125} = 5\sqrt{5}$.

Final answer

(a) $y = -2x$.

(b) $I = (-5, 10)$.

(c) $5\sqrt{5}$.

Question 6

Radians

6.

Not to scale

Figure 2

The shaded area in Figure 2 shows the plan view of a helicopter landing pad.

The area consists of the major sector AOB of a circle centre O joined to a triangle AOC .

Given that

- $AO = OB = 15$ m
- $BC = 2$ m
- CBO is a straight line
- angle $ACO = 0.6$ radians

(a) show that angle COA is 1.847 radians to 3 decimal places.

(3)

(b) Find the total area of the helicopter landing pad.

Give your answer in m^2 to 3 significant figures.

(3)

(c) Find the perimeter of the helicopter landing pad.

Give your answer in metres to 3 significant figures.

(3)

(Total for Question 6 is 9 marks)

Worked Solution - Question 6

Primary topic

1. Set up triangle AOC $AO = 15$, $OC = OB + BC = 17$, and $\angle ACO = 0.6$.**2. Use the sine rule**

$$\frac{\sin \angle CAO}{17} = \frac{\sin 0.6}{15}, \text{ so } \angle CAO \approx 0.6944 \text{ radians.}$$

3. Show angle COA $\angle COA = \pi - 0.6 - 0.6944\dots = 1.847\dots$, so $\angle COA = 1.847$ radians to 3 decimal places.**4. Major sector angle**The shaded sector is the major sector AOB , so its angle is $2\pi - 1.847\dots$.**5. Sector area**

$$\text{Sector area} = \frac{1}{2}(15)^2(2\pi - 1.847\dots) = 499.15\dots$$

6. Triangle area

$$\text{Area } AOC = \frac{1}{2}(15)(17) \sin(1.847\dots) = 122.73\dots$$

7. Total area $499.15\dots + 122.73\dots = 621.88\dots$, so the total area is 622 m^2 to 3 significant figures.**8. Find AC**By the cosine rule, $AC^2 = 15^2 + 17^2 - 2(15)(17) \cos(1.847\dots)$, so $AC \approx 27.57 \text{ m}$.

9. Major arc length

$$\text{arc } AB = 15(2\pi - 1.847\dots) = 66.54\dots \text{ m.}$$

10. Perimeter

$$66.54\dots + 27.57\dots = 94.11\dots, \text{ so the perimeter is } \mathbf{94.1 \text{ m.}}$$

Final answer

(a) $\angle COA = 1.847 \text{ rad.}$

(b) $622 \text{ m}^2.$

(c) 94.1 m.

10 marks

Question 7

Graphs of Functions

7.

Figure 3

Figure 3 shows a sketch of part of the curve C_1

Given that C_1

- has equation $y = f(x)$ where $f(x)$ is a cubic function
- touches the x -axis at the origin and cuts the x -axis at $x = 4$
- passes through the point $(10, 120)$

(a) find $f(x)$

(3)

The curve C_2 has equation $y = 1.2x(8 - x)$

On the following page there is a copy of Figure 3 called Diagram 1.

(b) On Diagram 1 sketch a graph of the curve C_2

(2)

(c) Use algebra to find the coordinates of the points where C_1 and C_2 intersect.
Show each stage of your working.

(5)

Diagram 1

(Total for Question 7 is 10 marks)

Worked Solution - Question 7

Primary topic

1. Use the repeated root at the origin

Since the cubic touches the x -axis at the origin and cuts it at $x = 4$, write

$$f(x) = \lambda x^2(x - 4).$$

2. Use the point (10,120)

$$120 = \lambda(10)^2(10 - 4) = 600\lambda, \text{ so } \lambda = 0.2.$$

3. State $f(x)$

$$f(x) = 0.2x^2(x - 4).$$

4. Sketch C_2

$C_2 : y = 1.2x(8 - x)$ is a downward-opening parabola through $x = 0$ and $x = 8$, with its maximum between them.

5. Set intersections equal

$$1.2x(8 - x) = 0.2x^2(x - 4).$$

6. Clear decimals

Divide by 0.2 to get $6x(8 - x) = x^2(x - 4)$.

7. Factor

$$48x - 6x^2 = x^3 - 4x^2, \text{ so } x^3 + 2x^2 - 48x = 0 \text{ and } x(x^2 + 2x - 48) = 0.$$

8. Solve for x

$$x = 0, \text{ or } x^2 + 2x - 48 = 0 = (x + 8)(x - 6), \text{ so } x = -8 \text{ or } x = 6.$$

9. Find y -values

Using $y = 1.2x(8 - x)$ gives $(-8, -153.6)$, $(0, 0)$ and $(6, 14.4)$.

Final answer

(a) $f(x) = 0.2x^2(x - 4)$.

(c) $(-8, -153.6)$, $(0, 0)$, $(6, 14.4)$.

Question 8

Integration

8.

**In this question you must show all stages of your working.
Solutions relying entirely on calculator technology are not acceptable.**

A curve has equation $y = f(x)$, $x > 0$

The point $P(4, 12)$ lies on the curve.

Given that

- $f'(x) = 3\sqrt{x} + kx^2$ where k is a constant
- the equation of the tangent to the curve at P has equation $y = 10x + c$ where c is a constant

(a) (i) show that $k = \frac{1}{4}$

(ii) find the value of c

(4)

(b) Hence find the value of $f''(x)$ at P .

(3)

(c) Find $f(x)$.

(4)

(Total for Question 8 is 11 marks)

Worked Solution - Question 8

1. Use the tangent gradient

The tangent at P has equation $y = 10x + c$, so the gradient at P is 10.

2. Show k

$$f'(4) = 3\sqrt{4} + k(4)^2 = 6 + 16k = 10, \text{ so } 16k = 4 \text{ and } k = \frac{1}{4}.$$

3. Find c

Substitute $P(4, 12)$ into $y = 10x + c$: $12 = 40 + c$, so $c = -28$.

4. Differentiate f prime

$$\text{With } k = \frac{1}{4}, f'(x) = 3x^{1/2} + \frac{1}{4}x^2.$$

5. Find f double prime

$$f''(x) = \frac{3}{2}x^{-1/2} + \frac{1}{2}x.$$

6. Evaluate at P

$$f''(4) = \frac{3}{2} \cdot \frac{1}{2} + 2 = \frac{3}{4} + 2 = \frac{11}{4}.$$

7. Integrate f prime

$$f(x) = \int \left(3x^{1/2} + \frac{1}{4}x^2 \right) dx = 2x^{3/2} + \frac{1}{12}x^3 + d.$$

8. Use P to find d

$$12 = 2(4^{3/2}) + \frac{1}{12}(4^3) + d = 16 + \frac{16}{3} + d.$$

9. State $f(x)$

$$d = -\frac{28}{3}, \text{ so } f(x) = 2x^{3/2} + \frac{1}{12}x^3 - \frac{28}{3}.$$

Final answer

$$(a)(i) \ k = \frac{1}{4}. \quad (a)(ii) \ c = -28.$$

$$(b) \ f''(P) = \frac{11}{4}.$$

$$(c) \ f(x) = 2x^{3/2} + \frac{1}{12}x^3 - \frac{28}{3}.$$

Question 9

Transformations

9.

Figure 4

**In this question you must show all stages of your working.
Solutions relying on calculator technology are not acceptable.**

Figure 4 shows a sketch of

- the graph C_1 with equation $y = \sqrt{2x}$
- the graph C_2 with equation $y = 12 - \sqrt{x}$

(a) Describe fully the single transformation that would transform

- the graph with equation $y = \sqrt{x}$ onto C_1
- the graph with equation $y = -\sqrt{x}$ onto C_2

(4)

The graphs C_1 and C_2 meet at the point P , as shown in Figure 4.

(b) (i) Show that the x coordinate of P is a solution of

$$\sqrt{x} = 12(\sqrt{2} - 1)$$

(ii) Hence find, in simplest form, the exact coordinates of P .

(6)

(Total for Question 9 is 10 marks)

Worked Solution - Question 9

1. Transform y equals root x to C_1

C_1 has equation $y = \sqrt{2x}$. This is obtained from $y = \sqrt{x}$ by a stretch parallel to the x -axis with scale factor $\frac{1}{2}$.

2. Equivalent description

Equivalently, $y = \sqrt{2x} = \sqrt{2}\sqrt{x}$ is a stretch parallel to the y -axis with scale factor $\sqrt{2}$. The mark scheme also accepts the horizontal stretch description.

3. Transform y equals minus root x to C_2

C_2 has equation $y = 12 - \sqrt{x} = -\sqrt{x} + 12$, so it is a translation of $y = -\sqrt{x}$ by $\begin{pmatrix} 0 \\ 12 \end{pmatrix}$.

4. Set the curves equal

At P , $\sqrt{2x} = 12 - \sqrt{x}$.

5. Factor out root x

$\sqrt{2}\sqrt{x} + \sqrt{x} = 12$, so $(\sqrt{2} + 1)\sqrt{x} = 12$.

6. Rationalise

$$\sqrt{x} = \frac{12}{\sqrt{2} + 1} = \frac{12(\sqrt{2} - 1)}{(\sqrt{2} + 1)(\sqrt{2} - 1)} = 12(\sqrt{2} - 1).$$

7. Find x

$$x = [12(\sqrt{2} - 1)]^2 = 144(3 - 2\sqrt{2}).$$

8. Find y

$$y = \sqrt{2x} = \sqrt{2}\sqrt{x} = \sqrt{2} \cdot 12(\sqrt{2} - 1) = 24 - 12\sqrt{2}.$$

Final answer

(a)(i) stretch parallel to the x-axis scale factor $\frac{1}{2}$ (equivalently vertical stretch scale factor $\sqrt{2}$).

(a)(ii) translation by $\begin{pmatrix} 0 \\ 12 \end{pmatrix}$.

(b) $P = (144(3 - 2\sqrt{2}), 24 - 12\sqrt{2})$.

Question 10

Quadratics

10.

**In this question you must show all stages of your working.
Solutions relying on calculator technology are not acceptable.**

$$(k-1)x^6 + 4x^3 + (k-4) = 0 \quad \text{where } k \text{ is a constant}$$

- (a) Find the exact solutions to the given equation for $k = 4.5$ (3)
- (b) Find the set of possible values of k for which the given equation has no real roots. (4)

(Total for Question 10 is 7 marks)

Worked Solution - Question 10

1. Substitute k equals 4.5

The equation becomes $3.5x^6 + 4x^3 + 0.5 = 0$.

2. Clear decimals

Multiplying by 2 gives $7x^6 + 8x^3 + 1 = 0$.

3. Use a quadratic in x cubed

$$7x^6 + 8x^3 + 1 = (x^3 + 1)(7x^3 + 1) = 0.$$

4. Solve for x

$$x^3 = -1 \text{ or } x^3 = -\frac{1}{7}, \text{ so } x = -1 \text{ or } x = -\sqrt[3]{\frac{1}{7}}.$$

5. View the equation as a quadratic

Let $u = x^3$. Then the equation is $(k - 1)u^2 + 4u + (k - 4) = 0$.

6. Use no real roots

Since every real value of u gives a real x , the original equation has no real roots exactly when this quadratic in u has no real roots.

7. Use the discriminant

Require $b^2 - 4ac < 0$: $16 - 4(k - 1)(k - 4) < 0$.

8. Simplify

$16 - 4(k^2 - 5k + 4) < 0$ gives $20k - 4k^2 < 0$, so $4k(5 - k) < 0$.

9. Solve the inequality

$4k(5 - k) < 0$ for $k < 0$ or $k > 5$.

Final answer

(a) $x = -1, -\sqrt[3]{\frac{1}{7}}.$

(b) $k < 0$ or $k > 5.$
